TITLE:

Pendulum Impact Testing Machine for the Determination of the Energy Capacity of Demolition (Mayatnikovyy koper dlya opredeleniya energoyenkosti razrusheniya)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 3, pp 361-362 (USSR)

ABSTRACT:

In the case of sample demolitions especially of rocks, due to impacts, only part of the impact energy can be transformed into demolition energy. In order to determine this part of the energy, a special pendulum impact testing machine was designed (Fig 1). The device has a pendulum anvil to which the rock sample is attached, and a pendulum hammer. Both pendulums are freely suspended on thin steel wire and can revolve in ball bearings around a fixed axle. By means of this device the energy amount, which is absorbed by cylindrical samples in the demolition process, as a function of the height of these samples was investigated. A diagram of the values obtained by the testing of concrete samples with an impact energy of 6 kgm is given (Fig 2). In the demolition process the absorbed energy mounts in proportion with the height of the sample and gradually approaches a constant value.

Card 1/2

SOV/32-25-3-43/62

Pendulum Impact Testing Machine for the Determination of the Energy Capacity
of Demolition

Investigations showed that the part of the energy which is absorbed at the demolition of the samples is approximately the same for various brittle materials, and is about 70% of the entire impact energy under the above mentioned conditions. There are 2 figures.

TITLE: Experimental study of the emission of radioactive colloidal Au¹⁹⁸, Na₂HP³²O₄, Na²⁴Cl, and NaI¹³¹ through the arachnoidal membrane

SOURCE: Meditsinskaya radiologiya, v. 9, no. 8, 1964, 60-70

TOPIC TAGS: nervous system, gold, sodium, isotopes, radiology

Abstract: By means of a new method of impressions (applications) taken from the surface of the exposed brain, study of the elimination of radioactive substances introduced into the fluid from the subarachnoidal space through the arachnoidal membrane into the subdural space was made possible. This method makes possible the precise characterization of the amount and location of the eliminates of the compounds tested through the arachnoidal membrane. Study of the elimination of the substances can be carried out dynamically with minute-by-minute sampling of the fluid from the subdural

Card 1/45

L 27829-65

ACCESSION NR: AP5007133

space. Experiments conducted by the impression method revealed the agreement of three indexes of the elimination of substances through the arachnoidal membrane: a) the intensity of visually distinguished color of the impressions by a dye introduced along with the isotope into the humor; b) the number of pulses per minute emitted by each impression, determined on a counting device; c) the extent of darkening on radioautographs of the impressions. It was established that colloidal Au^{198} is eliminated through sections of the arachnoidal membrane located above canals, distinguished by high permeability. Passing through these is the efflux and the humor itself. Au^{198} does not permeate through the neighboring sections of the arachnoidal membrane covering the cells. Elimination of crystalloid compounds -- $Na_2HP^{32}O_4$, $Na^{24}Cl$, and NaI^{131} -- is also carried out through the sections over the canals. However, due to the considerable diffusive capacity of these compounds, some of them are eliminated evidently also through the sections of the arachnoidal membrane covering cells. The curve of impression activity characterizing elimination of compounds through the arachnoidal membrane has a similar configuration in experiments with different isotopes. As a rule, elimination of all the isotopes tested began in 1-2 minutes after they were introduced into the cisterna magna, as soon as they had reached the channels of the cerebral

Card 2/4

L 27829-65

ACCESSION NR: AP5007133

hemispheric surface. In a few minutes more the intensity of isotope elimination reached a maximum. Then a more or less steep drop in elimination occurred, followed by the isotope elimination becoming even and lasting till the end of the observation (2 hours). The fact that not only $\text{Na}_2\text{HP}^{32}\text{O}_4$, Na^{24}Cl , and NaI^{131} , but also colloidal Au^{198} passes readily through the arachnoidal membrane confirms the extremely high permeability of the biological membranes for different compounds. Since

colloidal Au^{198} does not pass through the hemato-encephalic barrier, it must be assumed that the permeability of the arachnoidal membrane exceeds the permeability of the endothelium of bloodbearing cerebral capillaries. It is logical to assume that like $\text{Na}_2\text{HP}^{32}\text{O}_4$, and Na^{24}Cl , other endogenic compounds of the fluid are also eliminated through the arachnoidal membrane. Orig. art. has 6 figs. and 3 graphs.

Surface tensimetry as an assay method for pharmaceuticals: Acetate assays by surface tensimetry. M. A. Etlinger and M. S. Baron. *Pharmazie* 10, No. 2, 31-5 (1947).—At a concn. of 100 g./l. the surface tensions in dynes/cm. of some aq. acetate solns. were: HOAc 54.86, NaOAc 61.91, KOAc 59.98, Pb(OAc)₂ 61.21. At 10 g./l. the differences are much smaller. Acceptably accurate acetate assays can be made by acidifying with H₂SO₄ and measuring surface tension. The method is also applicable to basic A; acetate and to Burrow's soln. The low surface tension of Burrow's soln. is attributed to the presence of free HOAc.

USSR/ Chemistry - Books

Card 1/1 Pub. 147 - 35/35

Authors : Filatov, I. G.

Title : Bibliography. Reference book on physico-chemical values

Periodical : Zhur. fiz. khim. 30/1, 237-238, Jan 1956

Abstract : A critical review is given on a new reference book physico-chemical values composed by N. B. Baron; E. I. Kvyat; Ye. A. Podgornaya; A. M. Ponomareva; A. A. Ravidel' and Z. N. Timofeyeva and published by the GOSKHIMIZDAT in Leningrad in 1955. It is stated that the book contains a chart of Mendeleev's periodical system of elements, list of important constants (mass, electron charge, mass of protons, neutrons and alpha particles, gas constant, Avogadro, Planck, Boltzmann constants, etc.) and other thermodynamic values.

M. M. Baron and K. P. Mishchenko, The study of the composition and elasticity of vapor over solutions of sodium bromide in a binary solvent (methyl alcohol-water). p. 2667

The composition and partial elasticity of the vapor over solutions $\text{CH}_3\text{OH} - \text{H}_2\text{O}$ and $\text{NaBr} - \text{CH}_3\text{OH} - \text{H}_2\text{O}$ were measured at changes of concentration of the salt from zero to saturation and the composition of the solvent from 0 to 100 percent at temperatures 25 and 40°. The solubility of NaBr in $\text{CH}_3\text{OH} - \text{H}_2\text{O}$ at 25 and 40° is measured. The activities and relative activities of water and alcohol are calculated. The results are discussed from the view point of changes in the ratio between the components of the solvent near the ion.

Prakticheskiye raboty po fizicheskoy khimii (Practical Work in Physical Chemistry)
Leningrad, Goskhimizdat, 1957. 263 p. 11,000 copies printed.

Eds. (Title page): K.P. Mishchenko, Professor, and A.A. Ravdel', Docent;
Ed. (Inside book): N.K. Lobina; Tech. Ed.: Ye. Ya. Erlikh.

PURPOSE: This textbook was approved by the Ministry of Higher Education as a manual
for students of vuzes specializing in chemistry.

COVERAGE: The text covers the theoretical and practical aspects of experimental
physical chemistry. It is the aim of the authors to aid the student in his
laboratory work by preceding each experiment with a theoretical introduction,
a description of the apparatus, and the order of the determination and compu-
tation of results. Much attention is given to the fundamentals of chemical
thermodynamics, reaction kinetics, and equilibrium. The basic techniques of

Card 1/14

Practical Work in Physical Chemistry

experimentation and the treatment of experimental data are presented so as to enable the student to work independently. The text was prepared jointly by the staff of the Department of Physical Chemistry, Leningradskiy tekhnologicheskii institut imeni Lensovet_s (Leningrad Technological Institute imeni Lensovet) with K. P. Mishchenko and A.A. Ravdel' as editors, and N. M. Baron and A.M. Ponomareva as coeditors. The book was reviewed by Professors V.A. Kiryeev, B.P. Nikol'skiy, corresponding member of the AS USSR, and by the staff of Professor Nikol'skiy. There are no references.

Orig Pub: Tr. Leningr. tehnol. in-ta im. Lensovet, 1957, vyp. 37,
10-18.

Abstract: The density of solutions $\text{CH}_3\text{OH} - \text{H}_2\text{O}$ and $\text{CH}_3\text{OH} - \text{H}_2\text{O} - \text{NaBr}$ were measured at 25° in the salt molar concentration range from 0.1 to 1.0 and in the range of the alcohol concentration in the solvent from 0 to 99.5% by weight. The apparent molar volumes (\bar{V}) of the salt were computed. The curves of the dependence of \bar{V} on the solvent composition and the salt concentration in the solution were plotted. A trial was made to compute the apparent molar volumes of alcohol and water in 3-component

PURPOSE: This book is intended for students at schools of higher education and technicians, aspirants, and teachers.

COVERAGE: This handbook contains tables on the most important physical and chemical values used in physical chemistry laboratory work and for various calculations in physics and chemistry. In this third edition of the handbook important changes have been included in the tables for radioactivity and nuclear reaction, thermodynamic values, empirical data and ratios for calculating thermodynamic values, and photochemical reactions. The remaining tables have been revised and slightly enlarged. The tables for radioactivity, nuclear

TITLE: On the Electric Conductivity of NaCl at Low Temperatures
(Ob elektroprovodnosti NaCl pri nizkikh temperaturakh)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 1,
pp 234-235 (USSR)

ABSTRACT: The specific conductivity of NaCl solutions was investigated at 25, -8 and -17°. Sodium chloride solutions show no maximum electric conductivity at 18°. A maximum of electric conductivity may be seen at -8° with a composition of 24.4 wt % NaCl (9.08 mol.%). The electric conductivity of sodium chloride at a low temperature confirms the rules found by M. A. Klochko (Ref 1). V. V. Verkholtantsev participated in the investigation under review. There are 2 figures, 1 table, and 7 references, 3 of which are Soviet.
